

ART EQUILIBRIUM ASSET README

Setup Guide / Render Pipelines / Shaders / Materials / Support

Version 1.0

Quick start

Import the package version that matches your render pipeline. If materials appear pink, check the shader section and import the correct shader version.

Contents

- 1. Render pipeline version
- 2. Import and post-processing
- 3. Shader overview
- 4. How to use AE/Grunge
- 5. How to use AE/Leaves
- 6. Pink material / shader fix
- 7. Door script
- 8. Materials
- 9. Support

Important

Screenshots and videos may be captured in a specific render pipeline version. For the same result, use the matching pipeline package and demo scene settings.

1. RENDER PIPELINE VERSION

This asset supports multiple Unity render pipelines. Import the version that matches your project.

Pipeline	Use this version when
Built-in Render Pipeline	Your project uses the default Unity renderer.
URP	Your project uses Universal Render Pipeline.
HDRP	Your project uses High Definition Render Pipeline.

If you use URP or HDRP, import the corresponding UnityPackage for that pipeline. Double-click the UnityPackage or use Assets -> Import Package -> Custom Package.

Do not mix pipeline versions

Pink materials or broken visuals often happen when a Built-in, URP, or HDRP shader is used in the wrong render pipeline.

EXAMPLES OF WHAT TO CONSIDER WHEN CHOOSING A PIPELINE

BUILT-IN	HDRP	URP
 ASSET NAME All None ☒ ASSET NAME ☒ Animation ☒ HDRP_ ASSET NAME .unitypackage ☒ Materials ☒ Models ☒ Other ☒ Prefabs ☒ Readme ☒ Scenes ☒ Textures ☒ URP_ ASSET NAME .unitypackage	 ASSET NAME All None ☒ ASSET NAME ☒ Animation ☒ HDRP_ ASSET NAME .unitypackage ☒ Materials ☒ Models ☐ Other ☐ Prefabs ☐ Readme ☐ Scenes ☐ Textures ☐ URP_ ASSET NAME .unitypackage	 ASSET NAME All None ☒ ASSET NAME ☒ Animation ☐ HDRP_ ASSET NAME .unitypackage ☒ Materials ☒ Models ☐ Other ☐ Prefabs ☒ Readme_Havana_Street.pdf ☐ Scenes ☒ Textures ☒ URP_ ASSET NAME .unitypackage

Quick start

Import the package version that matches your render pipeline. If materials appear pink, check the shader section and import the correct shader version.

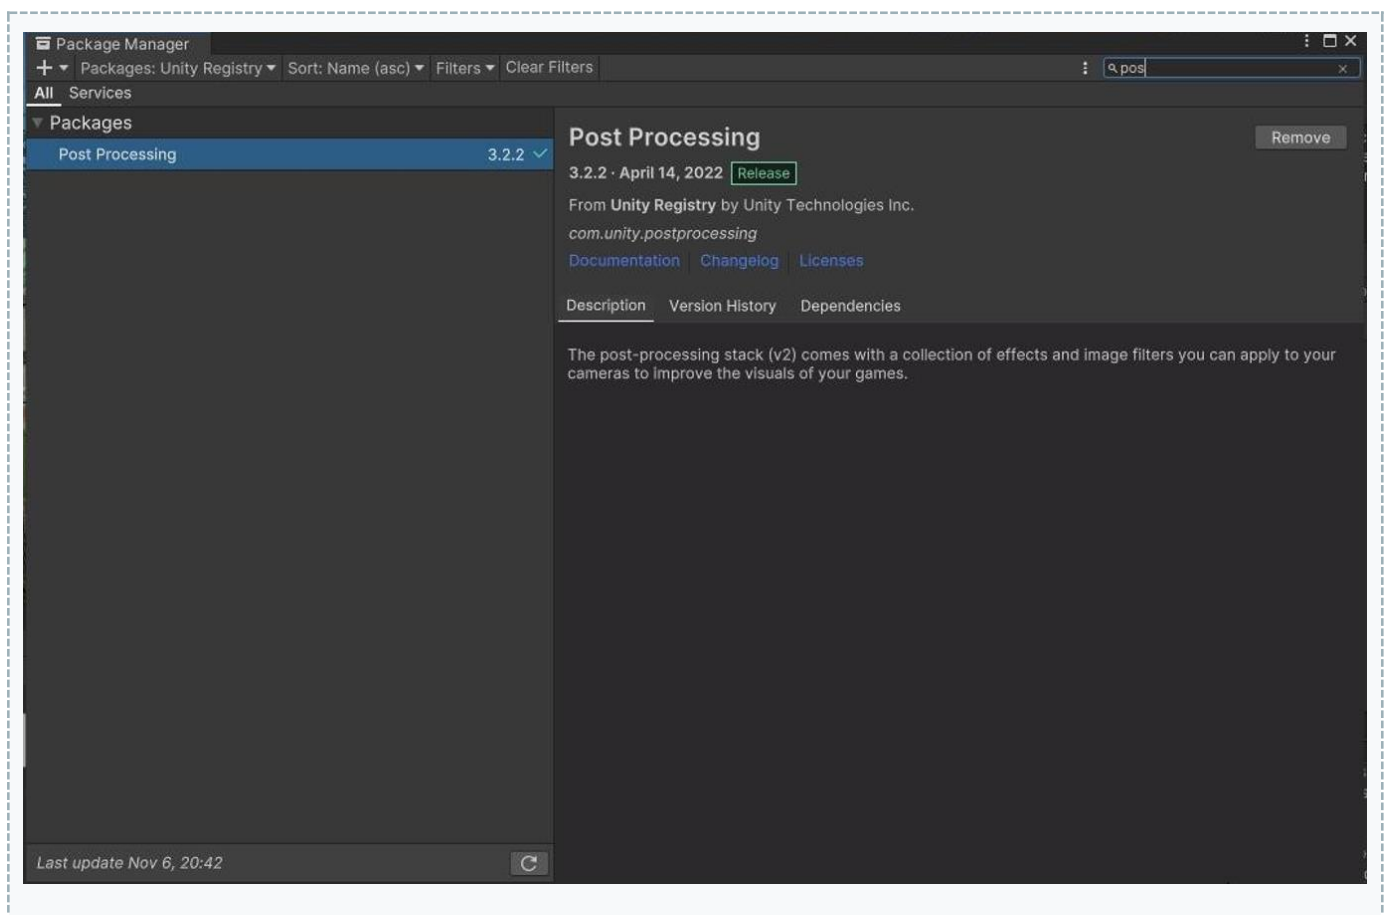

2. IMPORT AND POST-PROCESSING

To reproduce the look from the store screenshots and videos, use the included demo scene and the correct render pipeline setup.

- Open Unity Package Manager: Window -> Package Manager.
- Install the required render pipeline packages if your project does not already have them.
- For older Built-in projects, install Post Processing if the scene requires it.
- Open the demo scene and check that the Volume / Post Processing settings are enabled.

Note

Post-processing is optional for using the models, but it is recommended if you want the demo scene to match the store presentation.

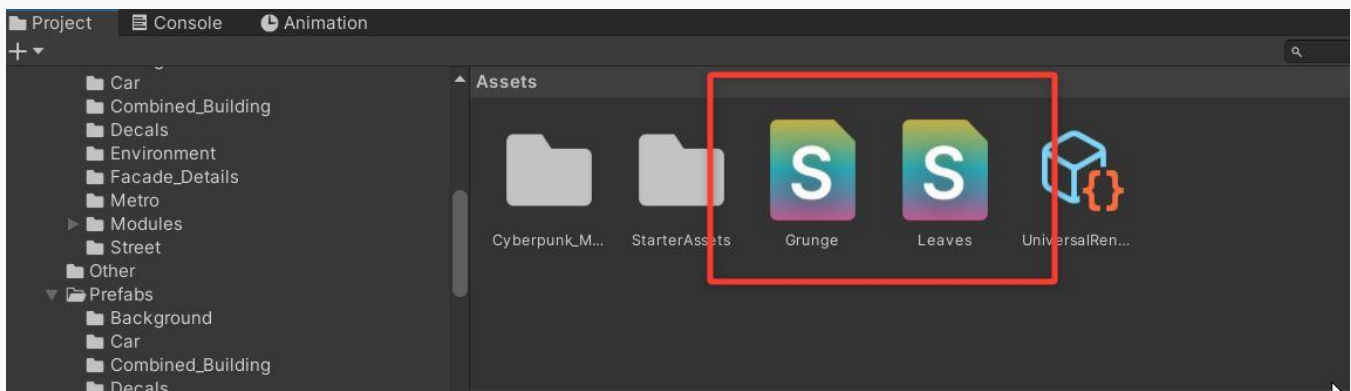

3. SHADER OVERVIEW

The asset can include custom shaders for hard-surface materials and vegetation. Use the shader version that matches your Unity version and render pipeline.

Shader	Purpose	Use for
AE/Grunge	Main hard-surface shader with tiling, tint, normal, AO, smoothness, and optional grunge overlay.	Buildings, roads, sidewalks, concrete, metal, props, background city modules.
AE/Leaves	Vegetation cutout shader with alpha clipping, tint, normal, mask support, and wind movement.	Leaves, grass, plants, bushes, trees, vegetation cards.

Simple rule

Use AE/Grunge for buildings and hard surfaces. Use AE/Leaves only for vegetation.

4. HOW TO USE AE/GRUNGE

AE/Grunge is the main shader for hard-surface materials. It is designed for modular buildings, roads, concrete, metal, props, and other urban surfaces.

Basic setup

- Select the material in the Project window.
- In the Inspector, set Shader to AE/Grunge.
- Assign the main texture maps.

Slot / Parameter	What it does
Base_Color	Main albedo / color texture.
Metallic_Smoothness	Packed metallic and smoothness texture. Use the texture supplied with the asset.
Normal	Normal map. Controls surface relief and small details.
Ambient Occlusion	AO texture. Adds extra contact darkness and depth.
Tiling_Main_Texture	Controls tiling of the main textures. Increase values for smaller repeated texture scale.
Tint	Color tint applied to the material. Keep white for original texture color.
Smoothness	Global smoothness amount. Lower values look rougher; higher values look more reflective.
Normal_Scale	Strength of the normal map.

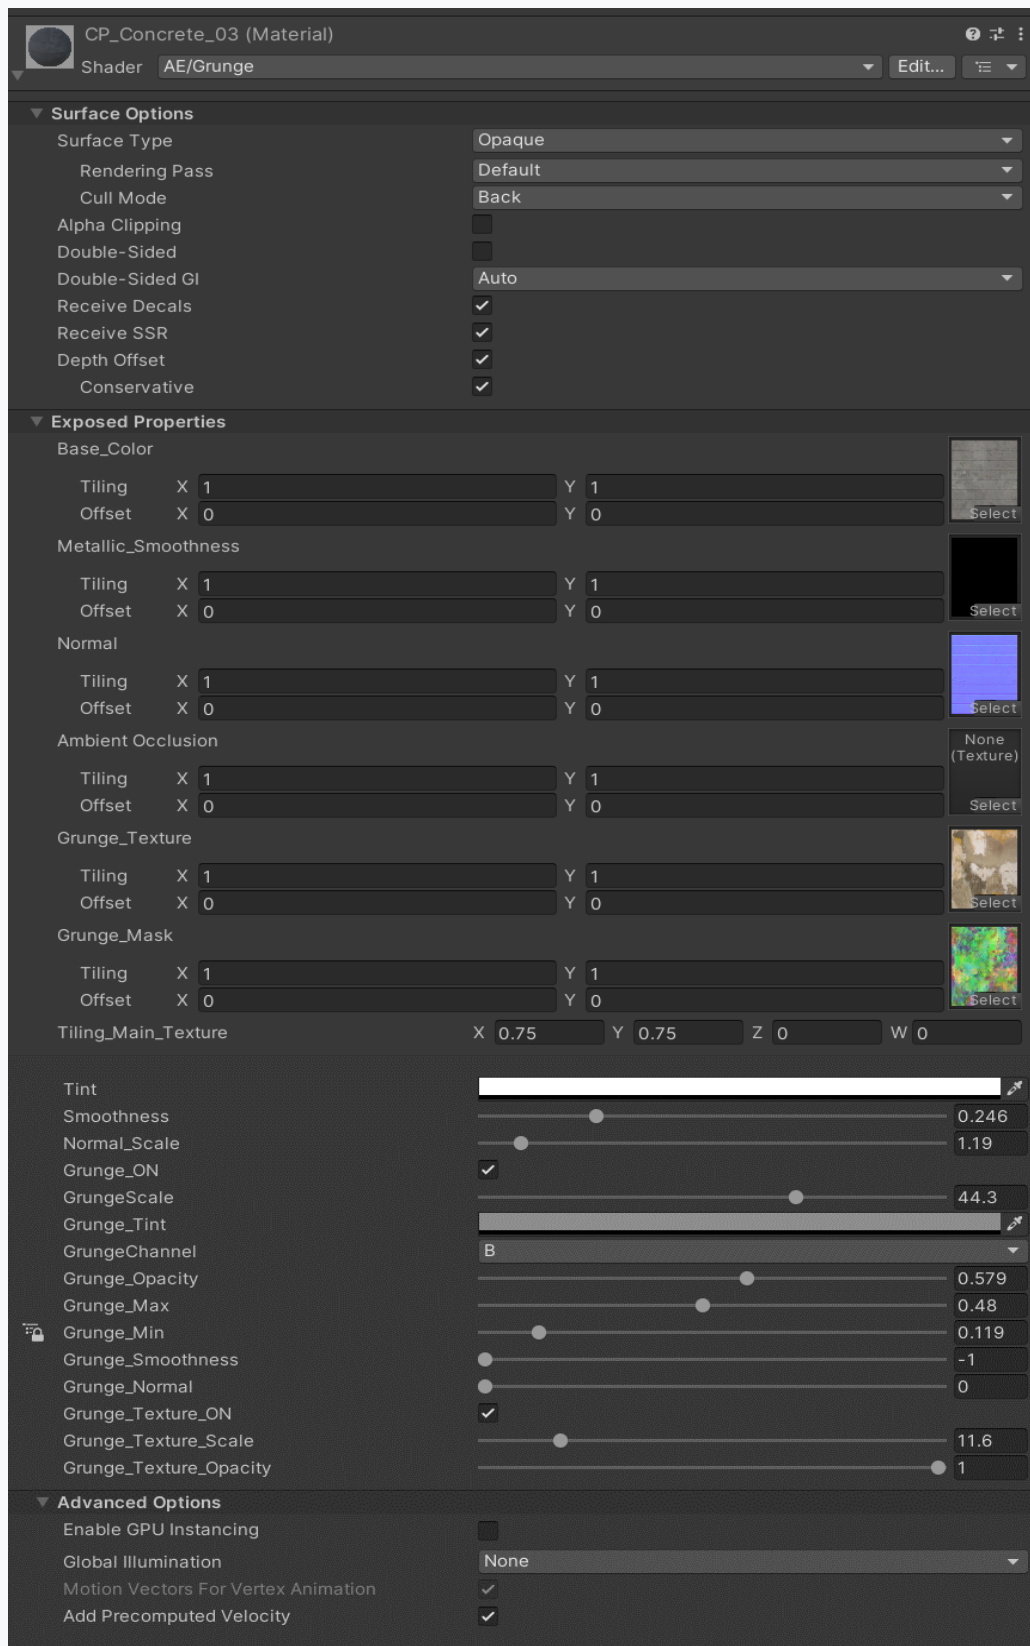

Grunge overlay

The grunge controls add dirt, wear, stains, and aging without replacing the base texture.

Parameter	Use
Grunge_ON	Turns the procedural grunge effect on or off.
GrungeScale	Changes the size of the grunge pattern.
Grunge_Tint	Controls the color of the dirt / wear overlay.
GrungeChannel	Selects which channel from the grunge mask is used.
Grunge_Opacity	Overall strength of the grunge effect. Reduce it if the material looks too dirty.
Grunge_Min / Grunge_Max	Adjusts the visible range of the grunge mask.
Grunge_Smoothness	Changes the smoothness of the grunge layer.
Grunge_Normal	Controls how strongly grunge affects the normal detail.
Grunge_Texture_ON	Enables an additional grunge texture layer.
Grunge_Texture_Scale / Opacity	Controls scale and strength of the additional grunge texture.

Recommended workflow

Start with Base_Color, Normal, Metallic_Smoothness, and AO. Then enable Grunge_ON and adjust Grunge_Opacity until the material looks natural.

5. HOW TO USE AE/LEAVES

AE/Leaves is a vegetation shader. It is intended for alpha-cutout meshes such as leaves, grass, bushes, small plants, and tree cards.

Basic setup

- Select the vegetation material in the Project window.
- In the Inspector, set Shader to AE/Leaves.
- Assign the vegetation textures supplied with the asset.

Slot / Parameter	What it does
Base_Color	Main leaf texture. The alpha channel controls the cutout shape.
Mask Clip Value	Controls alpha clipping. Lower value keeps more pixels; higher value cuts more pixels away.
Mask	Packed support texture for material response. Use the mask supplied with the asset.
Normal	Normal map for leaf surface detail.
Color	Main color tint. Use white to keep the original texture color.
Color_Tiling	Additional color variation tint.
Tiling / Tiling_Color	Controls texture and color variation scale.
Normal_Power	Strength of the normal map.
Smoothness_Power	Controls the smoothness response from the mask.
Ambient_Occlusion	Controls additional occlusion strength.

Wind controls

The wind parameters add simple movement to vegetation. Keep them low for realistic motion.

Parameter	Use
Wind Scale	Scale of the wind movement pattern.
Wind Power	Strength of the movement. Increase carefully.
Wind Speed	Speed of the wind animation.
Wind_Size	Size of wind variation across the mesh.
Noise	Noise texture used to drive the wind pattern.

If vegetation edges look wrong

Adjust Mask Clip Value. If edges disappear too much, lower it. If there are unwanted transparent borders, raise it slightly.

6. PINK MATERIAL / SHADER FIX

Hi there! If you downloaded my project and noticed that some materials appear pink or encounter other errors, it means the shader of my asset is outdated. You need to replace it with the shaders available on Google Drive. Download the shader based on your render pipeline. Here's the simplest way to replace it.

This problem is due to the fact that unity is constantly changing the API and the old shaders stop working correctly

Sorry for the inconvenience.

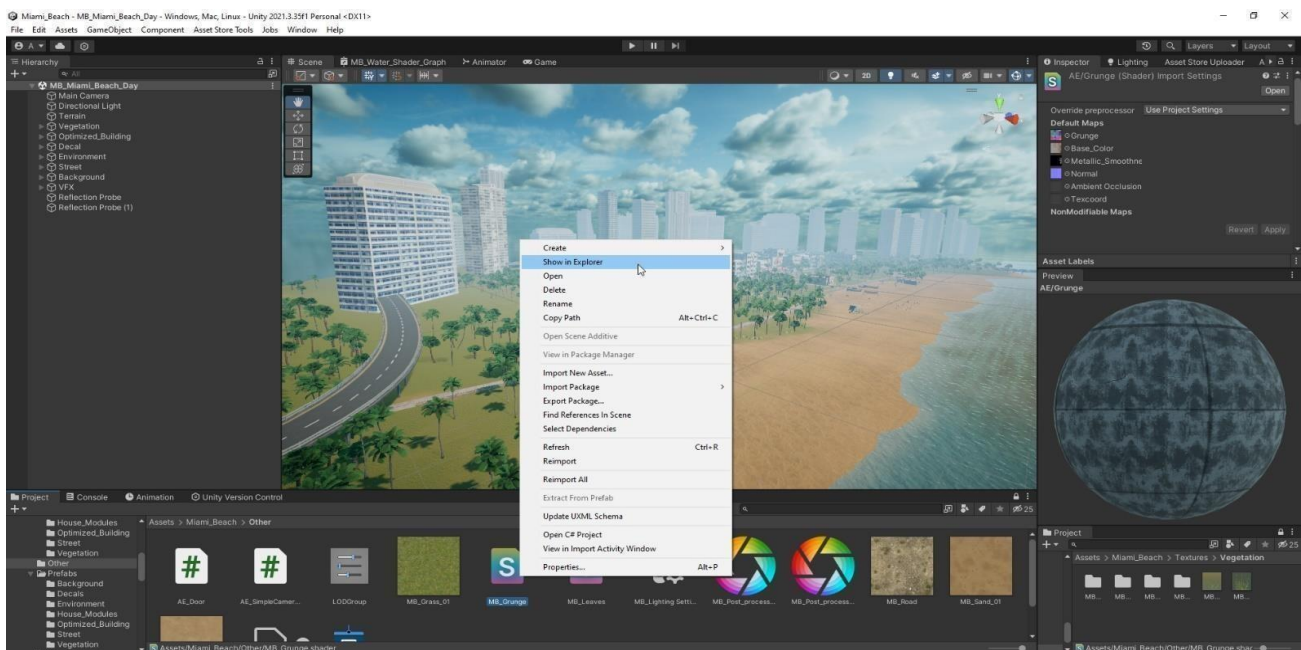

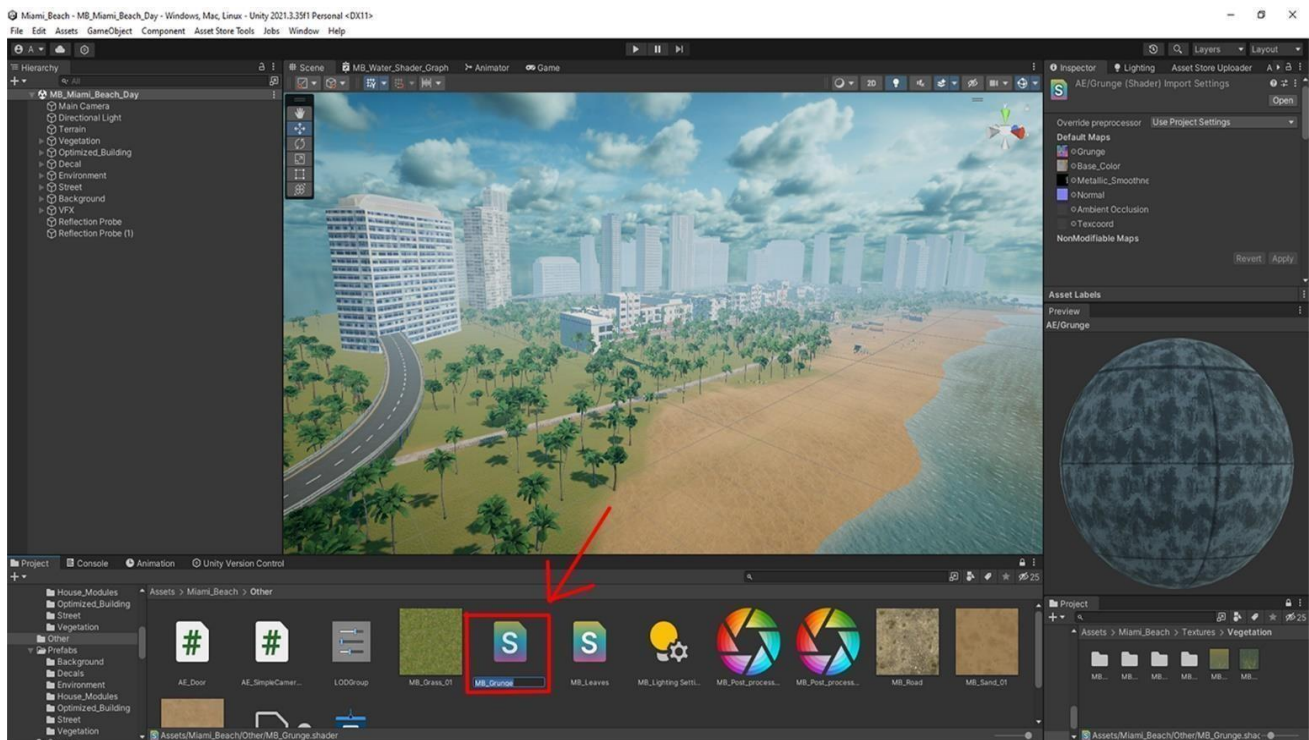

The first thing you need to determine about your project is which render pipeline you're using. Based on this, download the appropriate shader for your needs.

- The Standard Shader does not have any specific markings.
- HDRP and URP shaders are marked accordingly.

- Grunge.shader
- HDRP_Grunge.shader
- HDRP_Leaves.shader
- Leaves.shader
- URP_Grunge.shader
- URP_Leaves.shader

The most convenient way to replace the shader:

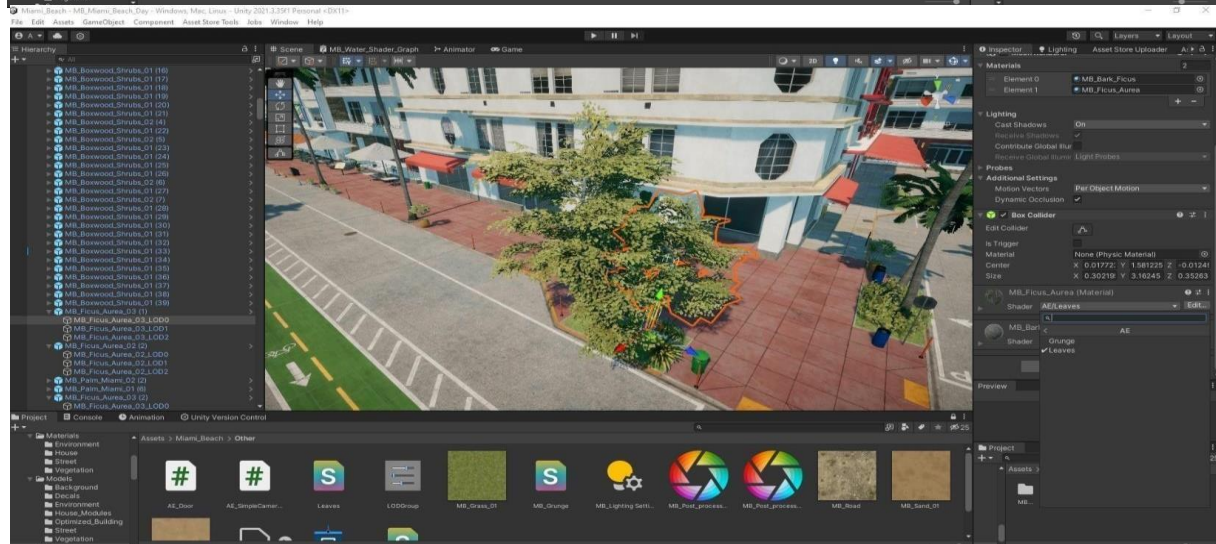

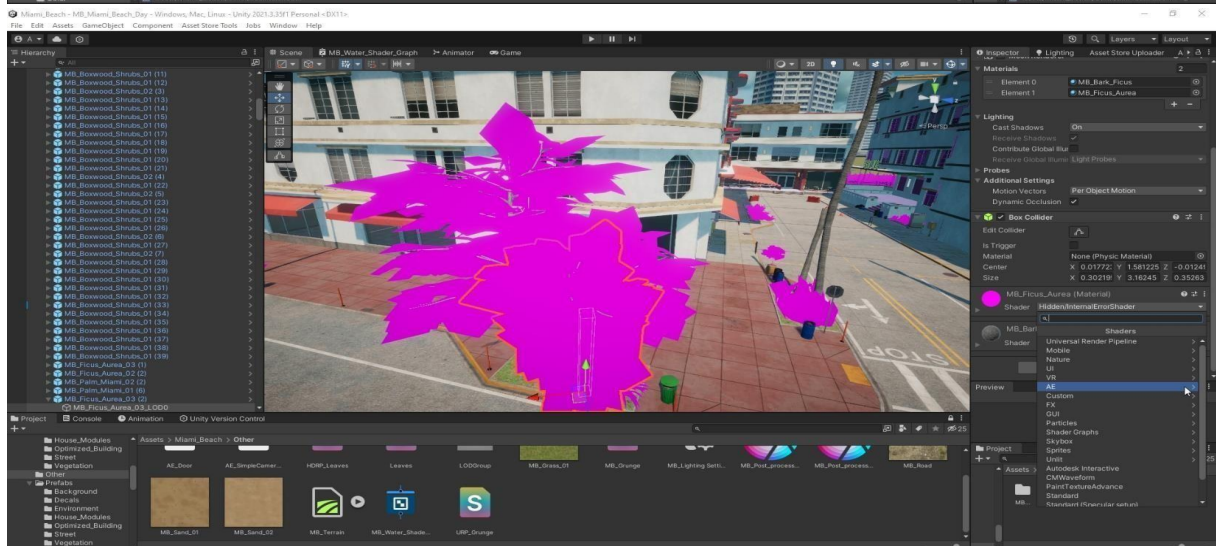

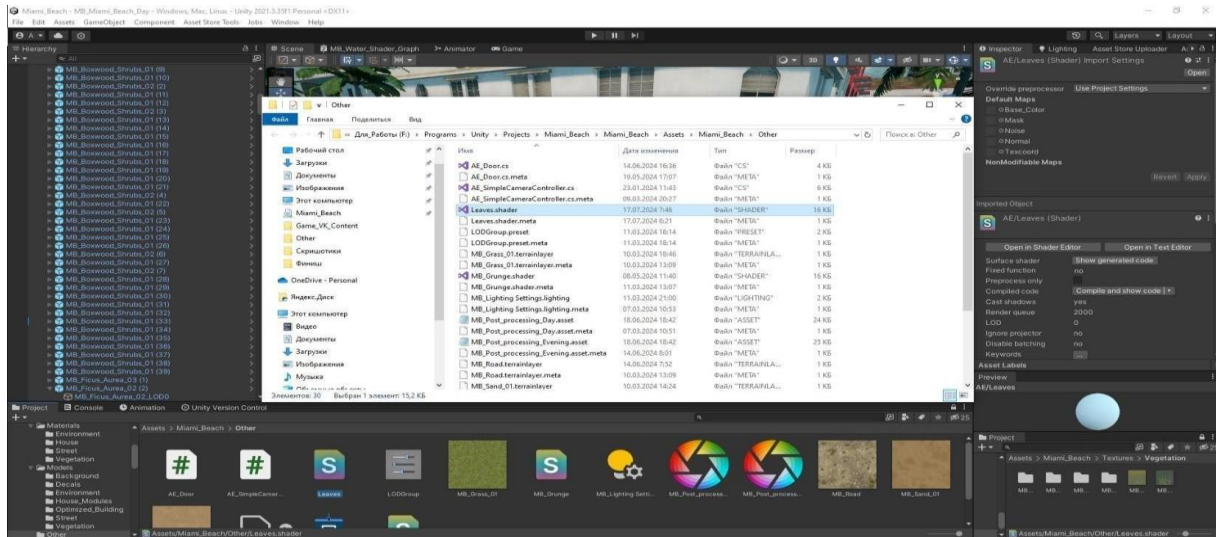

- Find this shader in the project. Its name is either Leaves or Grunge.
- Copy its name.
- Rename the shader you downloaded to the name from the project.
- Open the "Show in Explorer" tab, and a folder will open in Windows Explorer.
- Paste the downloaded file into the folder, replacing the existing one.
- All materials using this shader will automatically update to the latest version.

If this method doesn't work, please ensure you've followed all the steps correctly. If the first method fails, try the more reliable, but longer, method:

1. Delete the broken shader from your project.
2. Import the downloaded shader into your project (renaming is not necessary).
3. Assign the new shader to all pink materials.

PS If the pink material belongs to plants (e.g., grass, trees), use the Leaves shader. If it belongs to objects like buildings or roads, use the Grunge shader.

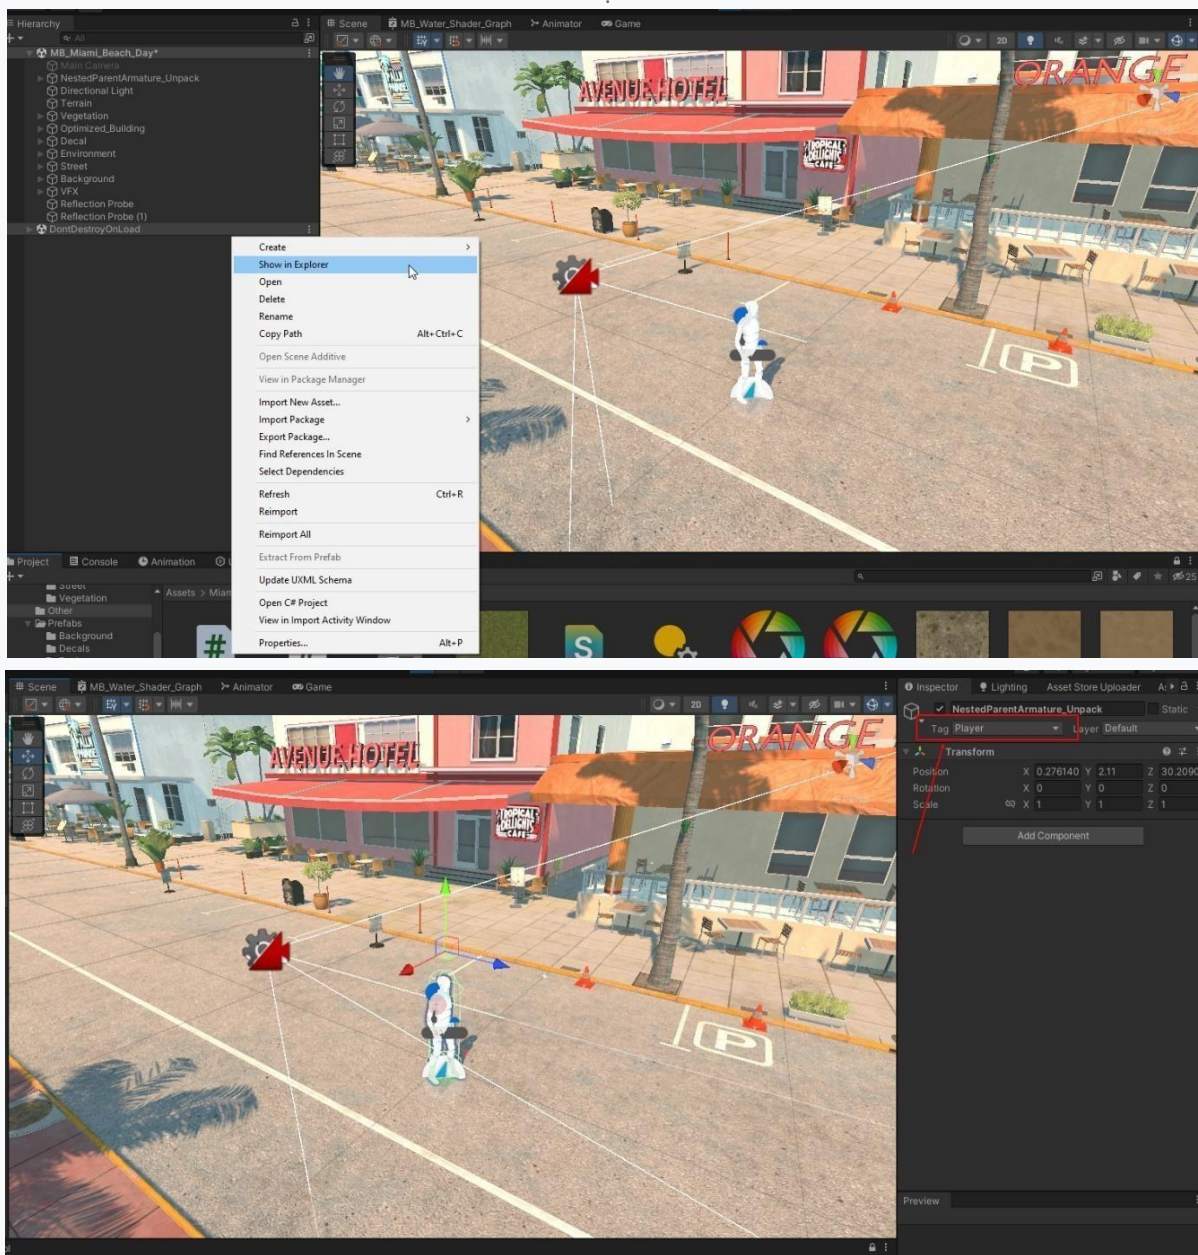

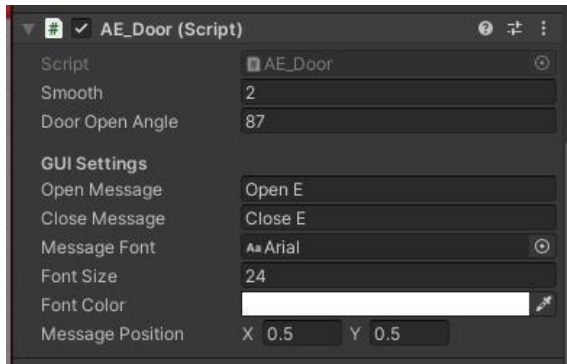

7. DOOR SCRIPT

Some assets include a simple interactive door script. It can be used in demo scenes or in your own scene.

- Assign the Player tag to your character object.
- Make sure the door trigger can detect the player.
- Select the door object and adjust the script settings in the Inspector.

Setting	Use
Smooth	Door movement speed.
Door Open Angle	Opening angle for a rotating door.
Is Sliding Door	Use this if the door should slide instead of rotate.
Slide Offset	Local movement offset for sliding doors.
Open / Close Message	Text shown to the player.
Font / Font Size / Font Color	Visual settings for the interaction message.
Open Sound / Close Sound	Optional audio clips for door movement.

8. MATERIALS

Many materials can be replaced or customized. This is useful for changing the look of walls, roads, sidewalks, concrete, metal, and props.

Replacing a tiled texture

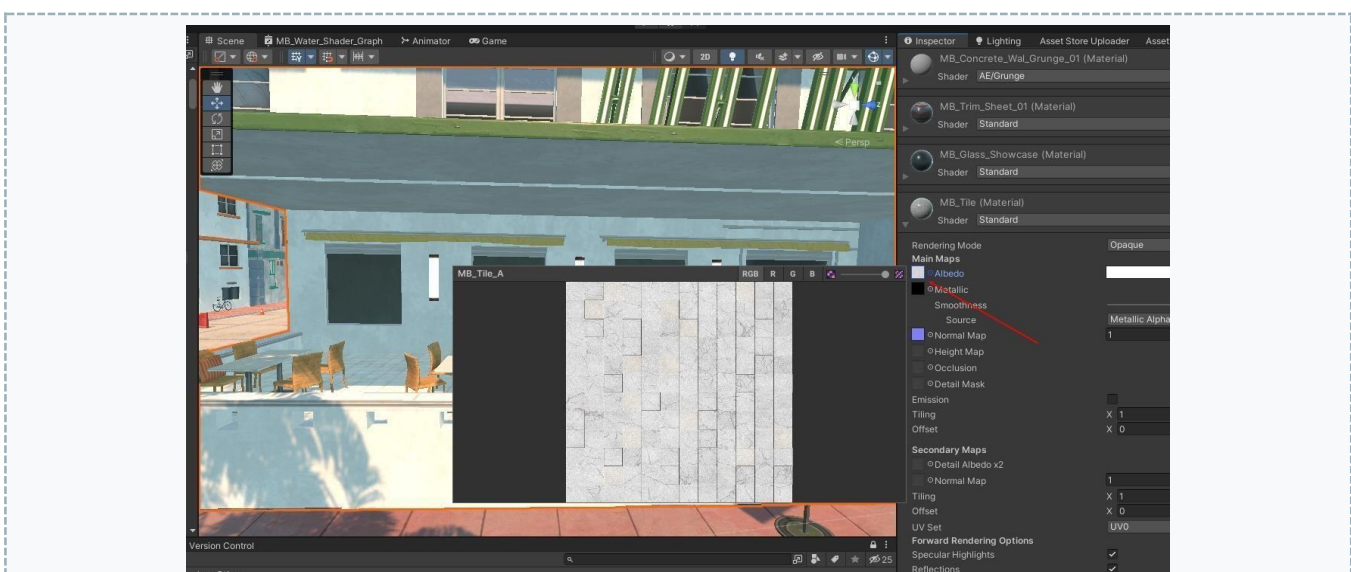

- Select the material you want to edit.
- Open the Albedo / Base_Color texture.
- Check if the texture is tiled and does not contain unique details.
- Replace it with another tiled texture if needed.
- All objects using this material will update automatically.

Creating a unique material

- Duplicate the original material.
- Assign your own textures or shader settings.
- Apply the new material only to the selected object.

Safe workflow

Duplicate a material before making major changes if you do not want to affect all objects that use the original material.

9. SUPPORT

If you have any issues with the asset, render pipeline setup, shaders, materials, or scripts, contact us by email:

Support email

art_equilibrium.studio@mail.ru

Please include this information when contacting support:

- Unity version
- Render pipeline: Built-in, URP, or HDRP
- Screenshot of the issue
- Short description of what happened

This helps us understand the issue faster and provide a better solution.
